Operating Values

#	Name	Value	Category	Description
1.	BOM Count	10		Total Design BOM count
2.	Total BOM	\$2.52		Total BOM Cost
3.	Cin IRMS	1.474 A	Capacitor	Input capacitor RMS ripple current
4.	Cin Pd	2.172 mW	Capacitor	Input capacitor power dissipation
5.	Cout IRMS	167.521 mA	Capacitor	Output capacitor RMS ripple current
6.	Cout Pd	52.057 μ W	Capacitor	Output capacitor power dissipation
7.	IC Ipk	3.29 A	IC	Peak switch current in IC
8.	IC Pd	1.494 W	IC	IC power dissipation
9.	IC Tj	73.466 degC	IC	IC junction temperature
10.	ICThetaJA	29.1 degC/W	IC	IC junction-to-ambient thermal resistance
11.	Iin Avg	1.271 A	IC	Average input current
12.	L Ipp	580.309 mA	Inductor	Peak-to-peak inductor ripple current
13.	L Pd	281.25 mW	Inductor	Inductor power dissipation
14.	Cin Pd	2.172 mW	Power	Input capacitor power dissipation
15.	Cout Pd	52.057 μ W	Power	Output capacitor power dissipation
16.	IC Pd	1.494 W	Power	IC power dissipation
17.	L Pd	281.25 mW	Power	Inductor power dissipation
18.	Total Pd	1.777 W	Power	Total Power Dissipation
19.	Duty Cycle	40.712 %	System	Duty cycle
20.	Efficiency	89.407 %	System	Steady state efficiency
21.	FootPrint	119.0 mm ²	System	Total Foot Print Area of BOM components
22.	Frequency	2.615 MHz	System	Switching frequency
23.	Iout	3.0 A	System	Iout operating point
24.	Mode	CCM	System	Conduction Mode
25.	Pout	15.0 W	System	Total output power

#	Name	Value	Category	Description
26.	Vin	13.2 V	System Information	Vin operating point
27.	Vout	5.0 V	System Information	Operational Output Voltage
28.	Vout Actual	5.0 V	System Information	Vout Actual calculated based on selected voltage divider resistors
29.	Vout Tolerance	3.528 %	System Information	Vout Tolerance based on IC Tolerance (no load) and voltage divider resistors if applicable
30.	Vout p-p	3.238 mV	System Information	Peak-to-peak output ripple voltage

Design Inputs

Name	Value	Description
Iout	3.0	Maximum Output Current
VinMax	13.2	Maximum input voltage
VinMin	10.8	Minimum input voltage
Vout	5.0	Output Voltage
base_pn	TPS62130A	Base Product Number
source	DC	Input Source Type
Ta	30.0	Ambient temperature

WEBENCH® Assembly

Component Testing

Some published data on components in datasheets such as Capacitor ESR and Inductor DC resistance is based on conservative values that will guarantee that the components always exceed the specification. For design purposes it is usually better to work with typical values. Since this data is not always available it is a good practice to measure the Capacitance and ESR values of C_{in} and C_{out} , and the inductance and DC resistance of L1 before assembly of the board. Any large discrepancies in values should be electrically simulated in WEBENCH to check for instabilities and thermally simulated in WebTHERM to make sure critical temperatures are not exceeded.

Soldering Component to Board

If board assembly is done in house it is best to tack down one terminal of a component on the board then solder the other terminal. For surface mount parts with large tabs, such as the DPAK, the tab on the back of the package should be pre-tinned with solder, then tacked into place by one of the pins. To solder the tab down to the board place the iron down on the board while resting against the tab, heating both surfaces simultaneously. Apply light pressure to the top of the plastic case until the solder flows around the part and the part is flush with the PCB. If the solder is not flowing around the board you may need a higher wattage iron (generally 25W to 30W is enough).

Initial Startup of Circuit

It is best to initially power up the board by setting the input supply voltage to the lowest operating input voltage 10.8V and set the input supply's current limit to zero. With the input supply off connect up the input supply to V_{in} and GND. Connect a digital volt meter and a load if needed to set the minimum load of the design from V_{out} and GND. Turn on the input supply and slowly turn up the current limit on the input supply. If the voltage starts to rise on the input supply continue increasing the input supply current limit while watching the output voltage. If the current increases on the input supply, but the voltage remains near zero, then there may be a short or a component misplaced on the board. Power down the board and visually inspect for solder bridges and recheck the diode and capacitor polarities. Once the power supply circuit is operational then more extensive testing may include full load testing, transient load and line tests to compare with simulation results.

Load Testing

The setup is the same as the initial startup, except that an additional digital voltmeter is connected between V_{in} and GND, a load is connected between V_{out} and GND and a current meter is connected in series between V_{out} and the load. The load must be able to handle at least rated output power + 50% (7.5 watts for this design). Ideally the load is supplied in the form of a variable load test unit. It can also be done in the form of suitably large power resistors. When using an oscilloscope to measure waveforms on the prototype board, the ground leads of the oscilloscope probes should be as short as possible and the area of the loop formed by the ground lead should be kept to a minimum. This will help reduce ground lead inductance and eliminate EMI noise that is not actually present in the circuit.

Design Assistance

1. Feature Highlights: DCS-Control(TM) Architecture with upto 3A output current, 3V to 17V Input Voltage Range, Adjustable output voltage from 0.9V to 6V Selectable operating frequency, Optional Softstart Capacitor for slow startup, Tracking, Pin selectable output voltage (nominal, +5%) Seamless Power Save Mode for Light Load Efficiency, Power Good Output, 100% Duty Cycle mode, Short Circuit Protection, PG=Low when device is in shutdown through EN, UVLO or Thermal Shutdown

2. Master key : 33CDBA79CB766D3F[v1]

3. **TPS62130A** Product Folder : <http://www.ti.com/product/TPS62130A> : contains the data sheet and other resources.
